ZIMBRA-TO-ZIMBRA MIGRATION SOFTWARE

Any version 8.8.15 or higher. Any OS. Any Zimbra edition.

All easily migrated — with the source left intact.

When a Rolling Upgrade or a system-to-system rsync just won't do, our bespoke migration software moves a **complete** Zimbra system onto fresh infrastructure — recreating every account, user setting, and mailbox on the destination in **staged passes that keep users live on the source until a short, final cutover** — all while the original system stays **fully intact as your fallback**.

PLATFORM-INDEPENDENT	RE-ARCHITECT FREELY	BATTLE-TESTED	ZERO-RISK SOURCE
FOSS ↔ Network Edition, any OS	Change server count & topology	Refined on real customer cutovers	Original system left untouched

BUILT FOR THE MIGRATIONS THAT MATTER

Reach for our migration software when:

01 A Rolling Upgrade or an rsync migration isn't appropriate — for example when S3 is present on the source system.

02 You bought a Network Edition license and need to migrate off an existing Open Source system.

03 You're a Zimbra BSP partner onboarding a new customer's to-be-retired self-hosted Zimbra system.

04 You need as short a cutover window as possible — staged premigration passes move the mail while users stay on the source, so the cutover itself is minutes, not days.

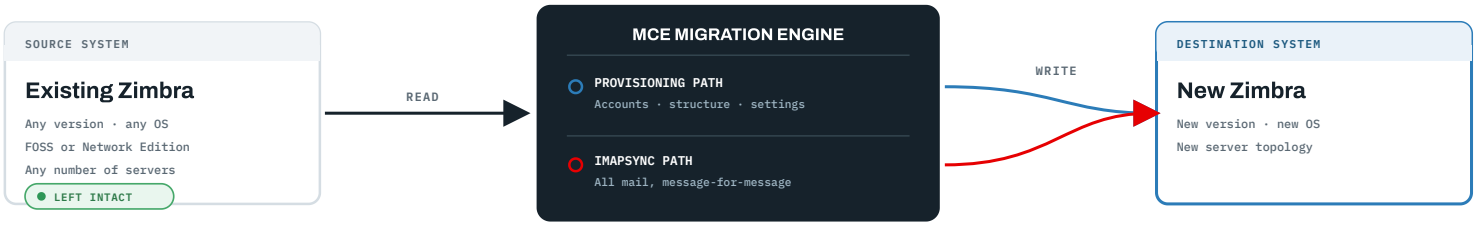

05 You're a hosting provider absorbing customers in waves — domain-scoped licensing migrates one wave of domains at a time onto the same destination farm.

// EXAMPLE MIGRATION

SOURCE		DESTINATION
Zimbra 9.0.0 FOSS Ubuntu 18	→	Zimbra 10.1 NE Rocky Linux 9

Different versions, different OS, FOSS → Network Edition — and a **different number of servers** in the same move. **Our software does that.**

HOW IT WORKS — A TWO-PATH ARCHITECTURE

Provisioning recreates the full system — users, structure, and settings — while **IMAPSYNC** moves every message in parallel. The source is read, never altered, so you always have a clean rollback.

Certified across the Zimbra spectrum

SALES · ENGINEERING · ADMIN · GOLD VAR · SILVER BSP · INSTRUCTOR

WHAT MIGRATES — THE COMPLETE INVENTORY

A whole Zimbra system… recreated — not approximated.

Developed over many months of continuous refinement across real customer migrations. Our software, working with **IMAPSYNC**, migrates a complete system and leaves the source intact — just in case.

INFRASTRUCTURE

- **Classes of Service** with the full inheritance chain preserved. A name that already exists is restored as `<name>_restored` rather than overwriting, and affected domains/accounts are repointed.
- **Local domains & domain aliases**, plus each domain's default COS.
- **Per-domain DKIM keys** — signed mail keeps verifying at cutover with no DNS change.
- **Distribution lists**, their members, and DL aliases.
- **Resource accounts** (e.g. conference rooms).
- **External / virtual accounts** — off-domain users shared into internal folders or resources.

USER ACCOUNTS

- Password, display / given / surname
- **Two-factor authentication** — TOTP secret, scratch codes & app-specific passwords; users keep their authenticator, no re-enrollment
- Email aliases; preferred `From` address & display name
- Work title & company
- Full address, ZIP, and telephone
- Explicit per-account **COS** assignment
- All account-level **ACEs** and the `zimbraId`
- All **Sieve** scripts (filters)
- Personal Amavis block / allow lists & Trusted Senders
- Spell-check "words to ignore"
- **Out-of-office** auto-reply settings — message, external-sender variant, active window
- **Mail forwarding** — admin- and user-set forwarding addresses, with the local-delivery setting
- **Account status** (locked, closed, maintenance…) — applied after the final mail sync, so a disabled account can't block its own migration
- **Security-tightening CoS overrides** — password locks, per-seat feature grants (EWS, S/MIME), quotas, session lifetimes; every one applied is logged for review

MAILBOX CONTENT

- **All address books** — every contact folder and subfolder, not just `/Contacts`, each exported individually with names preserved.
- **All calendars** — every calendar folder and subfolder, not just `/Calendar`.
- **Briefcase** and **Tasks**.
- Email **signatures**.
- **RSS / URL feed folders** — recreated with their feed URLs, ready to poll.
- **Folder shares** — outgoing grants and incoming mountpoints, recreated in the correct dependency order. The **complete share topology** is preserved: shared calendar, contact, task, and briefcase folders are pre-created on the destination — even empty ones — so every grant lands.

ALL MAIL

Every share respected; every message copied by IMAPSYNC.

Folder sharing is handled accurately. IMAPSYNC migration scripts are created automatically with per-account folder exclusion lists. Folders User A shares to User B are only sync'd on User A's mailbox. User B sees those folders' contents when sharing is restored at the tail end of the migration. And **repeat passes are delta-fast**: a persistent sync cache lets the premigration runs do the heavy lifting while users stay on the source — the cutover pass moves only what's new.

What does not migrate // BY DESIGN

- **GALsync accounts.**
- **ActiveSync, S/MIME, ZCO/EWS, NE Backup** — NE-only features skipped on a Network Edition → FOSS move; no FOSS equivalent, and they would fail account creation. **Two-factor authentication is the exception — it migrates.**
- **Custom localconfig, MTA settings, SSL certs, branding, external auth** (Okta / JumpCloud / AD) — these belong to the destination's own build. Domains that authenticate against an external directory are detected and listed for you, so nothing is forgotten at cutover.
- **Policy-loosening account overrides** — one-off exemptions from Class-of-Service policy (e.g. a 2FA opt-out) are surfaced for review, not silently carried; the security-tightening direction migrates automatically.
- **Domain-level ACEs** — account-level ACEs do migrate.
- **Admin-role flags** (zimbraIsAdminAccount / delegated) — intentionally not set; admins are exported for reference and reconstructed deliberately.
- **Per-domain public-service hostname / port / protocol** — you set these on the destination, since they often change as a result of a migration.

MISSIONCRITICAL EMAIL

LICENSING

$495 per migration

$7.95 per mailbox migrated

Volume discounts available above 2,500 mailboxes.

Schedule a migration.
